

EVALUATION OF THE LASER FLUORIMETRIC METHOD IN THE URANIUM DETERMINATION  
OF SAFEGUARDS SAMPLES

Application of the laser fluorimetry in the direct determination of trace levels of uranium in aqueous samples has been evaluated. The various experimental parameters that influence the sensitivity and accuracy of the method have been investigated. The results obtained indicate the usefulness of the method in the uranium analysis of safeguards samples.

( Authors were requested to bring their contributions at the time of the meeting. As the complete manuscript did not arrive either at the meeting or during the immediately following work of editing, only the abstract is published. )
