Track 1

Presentation Summary:

The safety assessment of DSRS management is the analytical instrument (or method) aimed at identifying hazards and evaluating risks (radiological or otherwise) inherent in administrative or technical stages related to the predisposal period, under normal and accident conditions. The work aims to propose models representing radiation exposure scenarios, calculate doses in specific scenarios, and determine measures to prevent accidents and unacceptable exposures.

Presenter/Panelist

Heloisa Reis

Graduate Student in Nuclear Technology - Sealed Radioactive Sources (Waste Management)

Nuclear & Energy Research Institute, IPEN-CNEN/SP
